

TZB-145E

I've been commuting from Rockland to Westchester or CT the better part of the last 20 years. We don't need a solution that just answers whether to repair or replace the bridge. We need to address the entire 287 corridor from Suffern to Port Chester.

I think the best options include adding BRT and light rail service across the corridor as a component of the proposal. Obviously this means a new bridge, but with added components to ease congestion and offer other commuting options. I don't see how repairing the existing structure or merely building a new bridge that only handles cars addresses the traffic or pollution concerns. It still leaves us all with a lousy ride to work and back home.

Thanks for taking my comments.
